Product Description

Tuff Jug KTM Adapter - Ripper Cap Adapter for Shallow Tank Motorcycles

The Tuff Jug KTM Adapter is a purpose-built accessory that enables the Tuff Jug Ripper Cap to work with the shallow tank designs found on KTM, GasGas, and similar off-road motorcycles. The Ripper Cap's standard configuration is not compatible with shallow tanks due to the tank depth requirements of its nozzle length. The KTM Adapter slips onto the end of the Ripper Cap and re-profiles the nozzle tip to accommodate these shallow inlet designs, restoring full Ripper Cap performance - including automatic fluid cutoff at the nozzle end - to the widest range of motocross and enduro machinery.

Purpose Built for KTM and GasGas

KTM and GasGas off-road motorcycles use tank designs where the fuel inlet is shallow relative to the nozzle length of the standard Ripper Cap. Without the KTM Adapter, the Ripper Cap cannot seat properly in these tanks, preventing it from functioning as designed. The KTM Adapter solves this by modifying the effective nozzle profile to match the geometry of these shallow tank inlets, allowing the full-speed pour and auto-shutoff capabilities of the Ripper Cap to be used on these machines. If you ride KTM or GasGas and want the speed of the Ripper Cap, this adapter is the required accessory.

Maintains Auto-Stop Function

Unlike some Ripper Cap adapters that disable the auto-stop functionality of the cap in exchange for broader compatibility, the KTM Adapter is specifically engineered to maintain the Ripper Cap's fluid cutoff at the nozzle end. This means you retain the automatic overflow prevention that makes the Ripper Cap system so practical for rapid pit stop fueling. The tank is full when it is full - the adapter handles the rest.

Easy Installation - No Permanent Attachment

The KTM Adapter slips onto the end of the Ripper Cap without tools and does not permanently affix to the cap. Installation takes seconds. When you are not fueling a shallow-tank machine, the adapter can be removed just as quickly and stored in a kit bag or gear case for use when needed. This makes it practical to carry the adapter as a standard kit item without it adding any complexity to the Ripper Cap setup for standard fueling

tasks.

Fast Fueling for Motocross and Enduro Events

In motocross and enduro racing, fueling speed can determine outcomes. The Tuff Jug Ripper Cap pours 5 gallons in 38 seconds under standard conditions. The KTM Adapter brings that speed to the KTM and GasGas machinery that dominate competitive off-road racing. For pit crews and support riders who service KTM and GasGas bikes at events, this adapter is the missing piece that enables full Ripper Cap performance without compromise.

Who Needs the KTM Adapter

1. KTM motocross and enduro riders who want the speed of the Ripper Cap
2. GasGas riders whose tank geometry requires adapted nozzle depth
3. Any rider or team using shallow-tank off-road motorcycles that are incompatible with the standard Ripper Cap nozzle length
4. Pit support crews servicing KTM and GasGas bikes at competitive events

Small Investment, Big Performance Gain

The KTM Adapter is a compact, lightweight accessory that costs a fraction of the Ripper Cap itself, but unlocks the full Ripper Cap experience for a class of machines that would otherwise be incompatible. For KTM and GasGas riders and teams who have already invested in the Tuff Jug Ripper Cap system, the KTM Adapter is the logical and affordable next step to complete their pit fueling setup.

Use with Tuff Jug Ripper Cap Only

The KTM Adapter is designed for use with the Tuff Jug Ripper Cap specifically and is not intended for use with other cap systems or third-party containers. It is compatible with all three Tuff Jug Ripper Cap sizes - 5 gallon, 2.5 gallon, and 1.25 gallon - providing the same shallow-tank compatibility across the full range of Tuff Jug container capacities.
