SKU: VENT

Categories: [Tuff Jug](#)

Product Description

Tuff Jug Vent 2-Pack - Replacement Poly Vents for Utility Containers

The Tuff Jug Vent 2-Pack provides replacement poly vents for select Tuff Jug utility containers that use external venting. These closed-body poly vents are ready to install and require a simple drilling or puncturing step to activate airflow. Each pack includes two vents, giving you one for immediate installation and one as a spare. Available in Black and White to match your container color scheme.

What the Poly Vent Does

On Tuff Jug containers that use external venting, the poly vent is the component that allows air to enter the jug during dispensing, replacing the liquid volume being poured out and maintaining a smooth, consistent flow rate. Without a functional vent, a sealed jug creates a vacuum during pouring that interrupts flow and slows dispensing dramatically. The poly vent solves this by providing a controlled air entry point that equalizes internal pressure continuously as liquid exits the container.

Closed Vent - Activation Required

These vents arrive in a sealed, closed state. Before installation, the vent must be activated by drilling or puncturing the vent body to create the airflow passage. This manufacturing approach ensures the vents arrive in a clean, contamination-free state and gives the operator control over vent sizing. The activation step is quick and requires only a basic tool - a drill or a sharp punch is all that is needed.

When an External Vent Is Needed

External vents are recommended for Tuff Jug containers that are being used without an Auto Stop Spout or Ripper Cap, or when the Spout Adapter is in use and improved flow rate is desired. The Auto Stop Spout and Ripper Cap systems are internally vented and do not require - and in fact do not benefit from - an additional external vent. If you are using your container with a basic storage cap or another non-vented cap configuration, an external poly vent is the correct solution for maintaining proper airflow during dispensing.

Available in Black and White

The Tuff Jug Vent 2-Pack is available in Black and White, allowing you to match the vent color to your container color or cap color. Consistent color coordination across your Tuff Jug system helps maintain a professional appearance and makes the system components easy to identify at a glance in the field or in storage.

Two Vents Per Pack

Each pack contains two poly vents. Having two means you have a direct replacement for an existing damaged or missing vent plus a spare for future use. For operations running multiple containers, ordering multiple packs is an efficient way to maintain a small service inventory without placing frequent small orders. Poly vents are small, lightweight, and store easily in any tool kit or parts box.

Compatible with Select Tuff Jug Models

These poly vents are designed as replacement components for Tuff Jug containers that include or support external venting in their design. If you are uncertain whether your specific Tuff Jug container uses external venting or relies on the internal venting of an Auto Stop Spout or Ripper Cap, consult the Tuff Jug product documentation or model guide for your specific container version.

Long-Term Reliability in Field Conditions

Poly vents used on utility containers are exposed to fuel vapor, UV radiation, temperature variation, and physical contact from daily handling. The Tuff Jug poly vents are manufactured from materials selected for resistance to these exposure conditions, ensuring they remain functional and properly sealed around their installation point through extended service life. Replacing a worn or damaged vent with a fresh one from this kit restores the container's full airflow performance quickly and affordably.
